

Kitsap County Natural Resource Asset Management Project

Presentation By:

Matthew Medina (Kitsap County)

South Sound Science Symposium, Shelton WA

October 20th, 2022

"A community that embraces sustainability must continually improve the relationship between the developed and natural environment. This includes **managing the natural environment as an essential asset alongside other assets** like roadways, buildings, capital facilities and revenue. The natural environment provides services and economic benefits which require planning, coordination, monitoring, and supportive fiscal policies and strategies."

Framework Goals

Manage natural assets, similarly to other assets, by employing a systematic process for making strategic and risk-informed decisions about natural assets to ensure a sustainable delivery of services alongside other county services.

Project Goals

The Core Team is working to collaboratively **develop and implement a framework** for the county to proactively manage **shorelines, streams, and forests** in a way that prioritizes the benefits they provide and safeguards them for the future.

Natural asset management draws from the principles and practices of traditional asset management.

Concepts like ‘levels of service’ that are commonly used to manage built assets can be applied to natural assets to support monitoring and investment to improving asset condition.

Local governments need approaches for managing natural assets and the benefits they provide.

- Many ecosystem services are also essential public services
- Natural assets provide essential services and are often not adequately considered in local planning and land use policy
- Disconnect between land use planning and ecosystem recovery planning
- Climate change impacts and environmental degradation
- Responsibility to uphold treaty rights and work in partnership with Tribes and First Nations to recover ecosystems

Natural Assets

Wetlands, Forests, Stream, etc.

Enhanced Assets

Rain Gardens, Bioswales, Urban Trees, etc.

Engineered Assets

Green Roofs, Water Harvesting System, etc.

Natural asset management is a structured approach for local governments to manage natural assets to support thriving ecosystems and communities.

Attributes of Natural Assets

Streams

Forests

Shoreline

Attributes

Riparian Vegetation

Biological Condition

Water Quality

Fish Passage

Additional Information:

- Fish Distribution

Attributes

Forest Cover

Successional Class

Attributes

Shoreline Armor

Riparian Vegetation

Shellfish Growing Area

Additional Information:

- Eelgrass, Forage Fish, Feeder Bluff

Ecosystem Services of Natural Assets

Services

- Key species presence
- Ground and surface water
- Stream flow regulation
- Fish and wildlife habitat

Services

- Water cycle
- Wildlife habitat
- Climate resilience

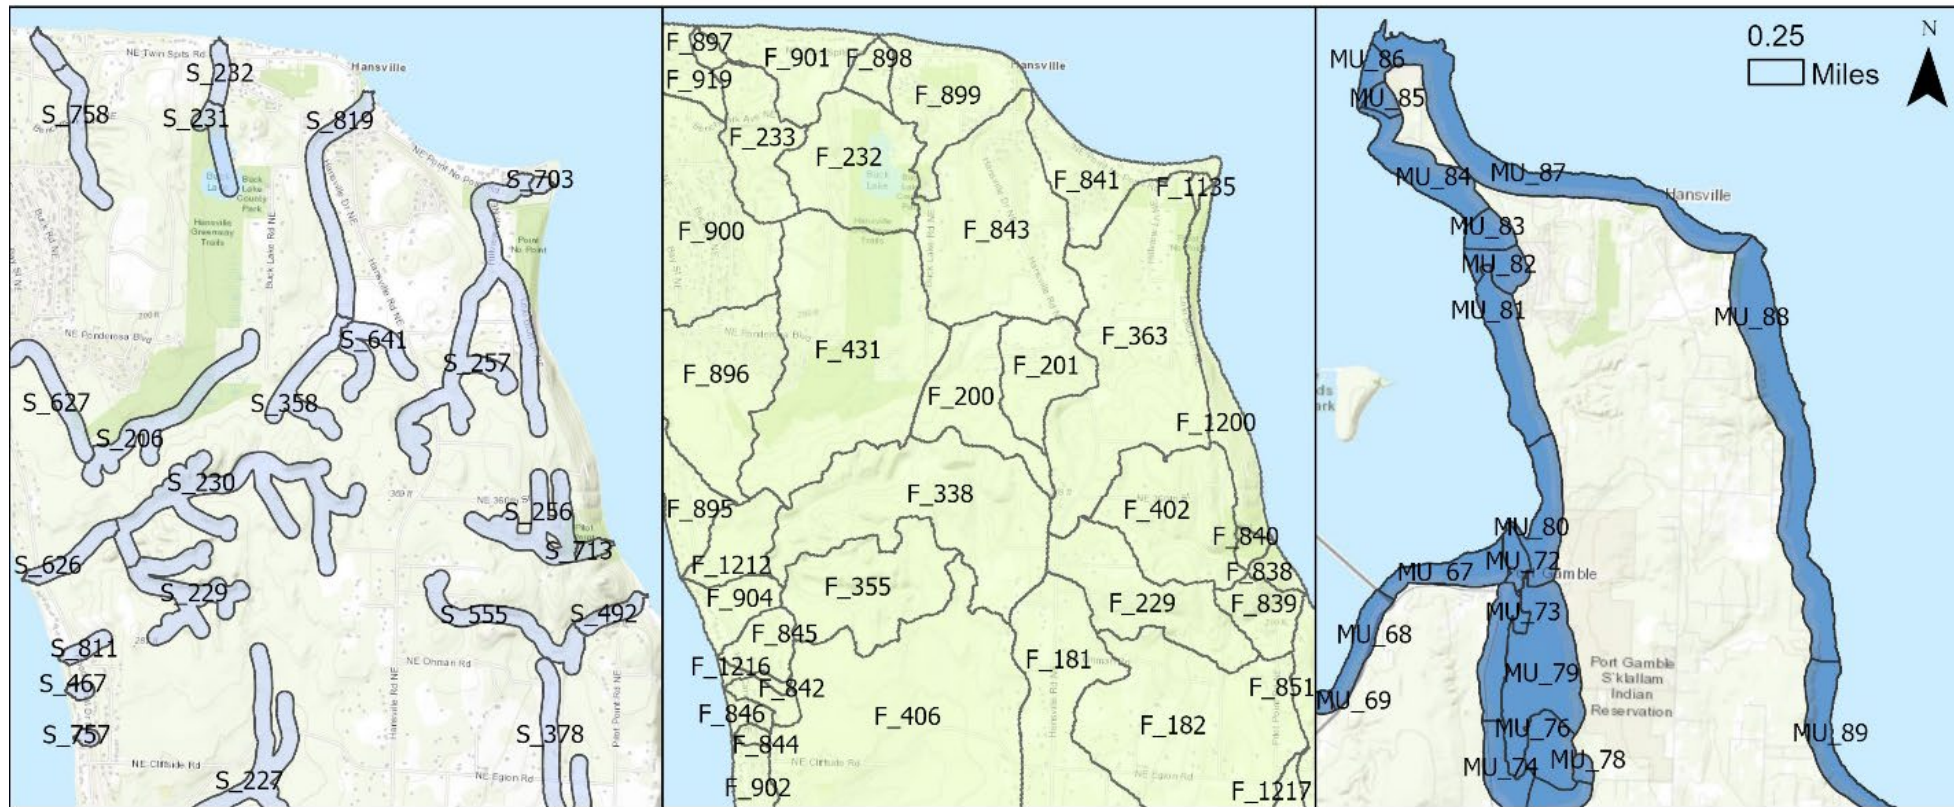

Services

- Food web and habitat
- Sediment supply
- Shellfish and seafood
- Climate resilience

Management Units

Management units - the spatial foundation of the KNRAMP system and provide the “container” for assessing the condition of natural assets and applying targets.

Levels of Service (LOS)

Desired LOS - The expected performance of assets and represent a commitment of a local government that will inform asset management and financial plans (MNAI 2022)

Low level of service

High level of service

0

Overall Condition Index

100

Degraded condition:

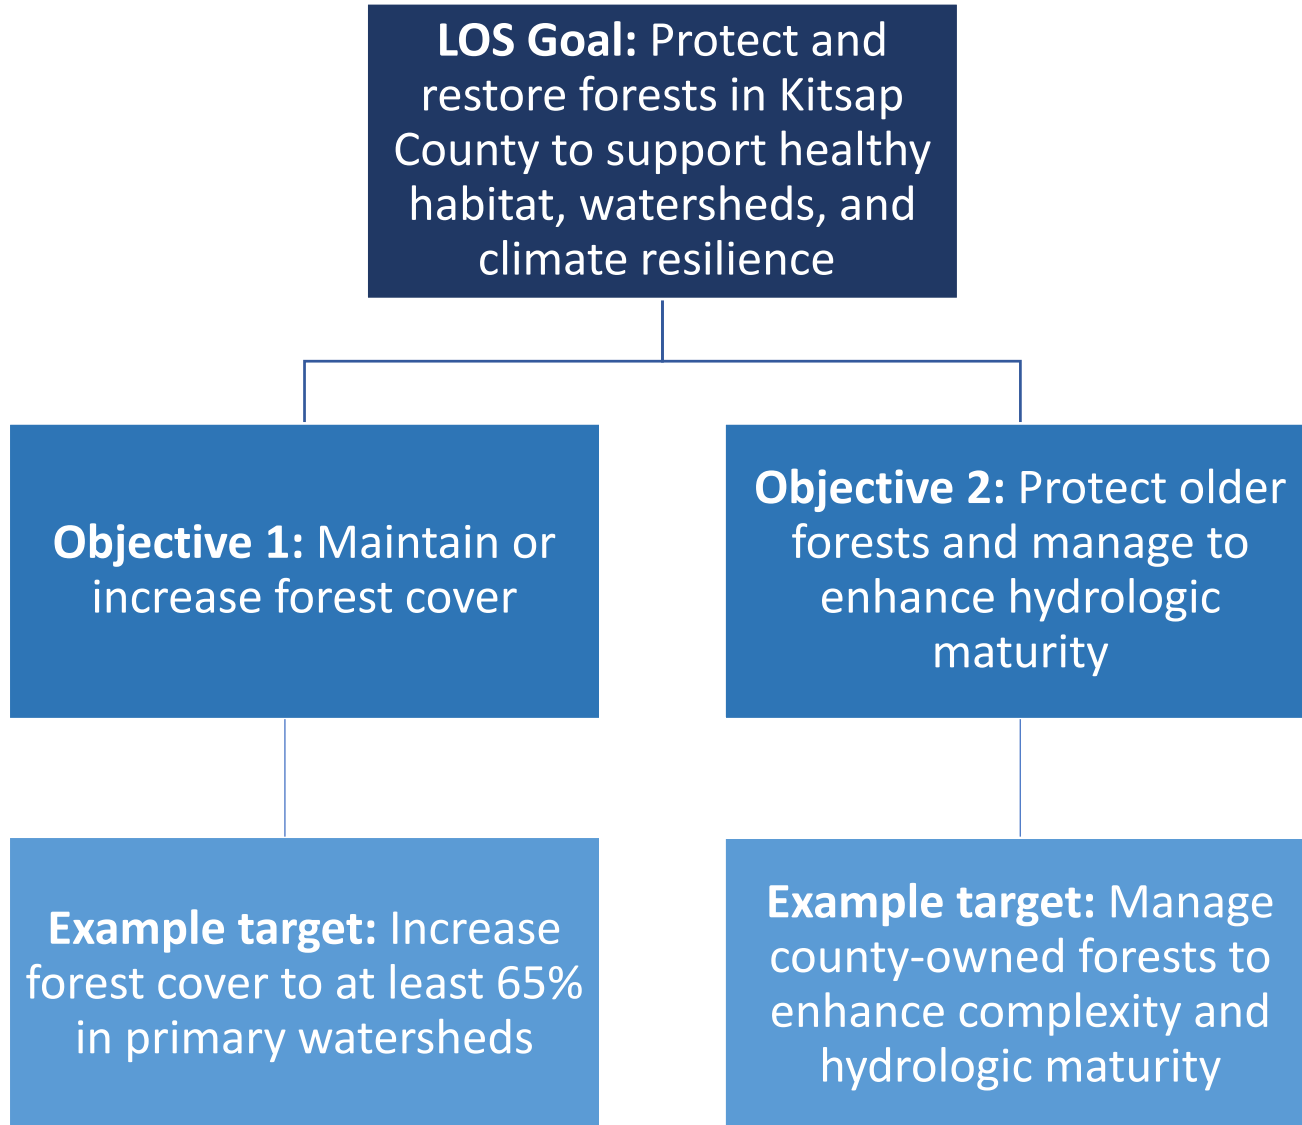

- Limited riparian tree cover
- Low B-IBI
- High bacteria
- Barriers to fish passage

Good condition:

- Significant riparian tree cover
- High B-IBI
- Low bacteria
- No barriers to fish passage

Desired Level of Service – Forest Assets

Desired level of service challenges:

- Geographic and temporal scales? Rural vs. Urban? Short term vs long-term?
- Process for formalizing and adopting LOS?

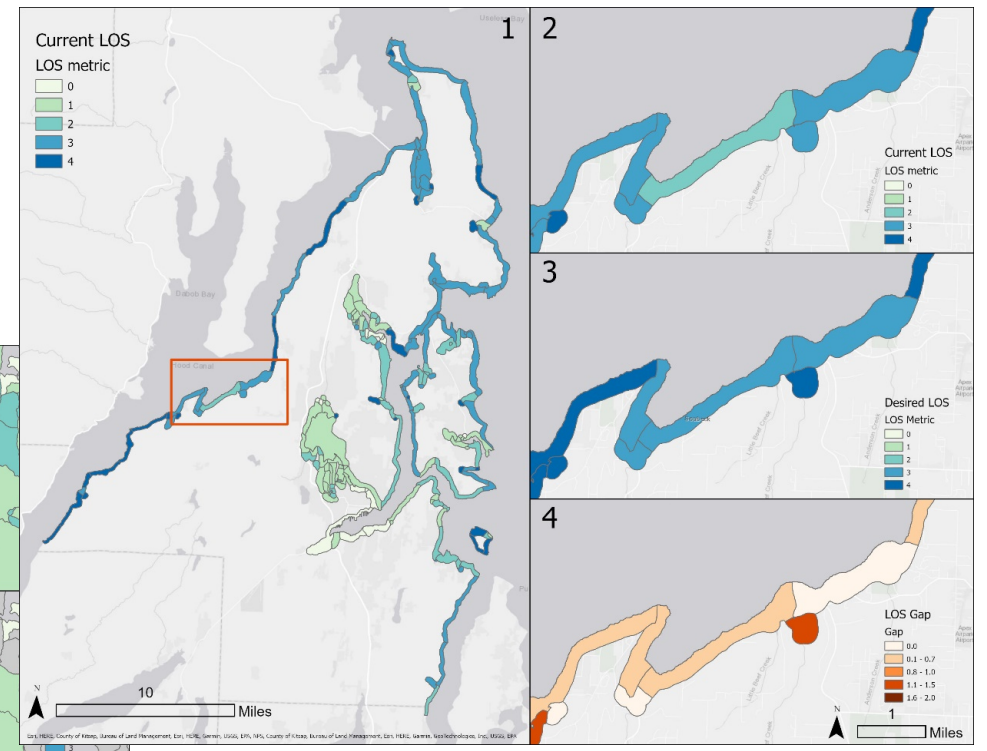

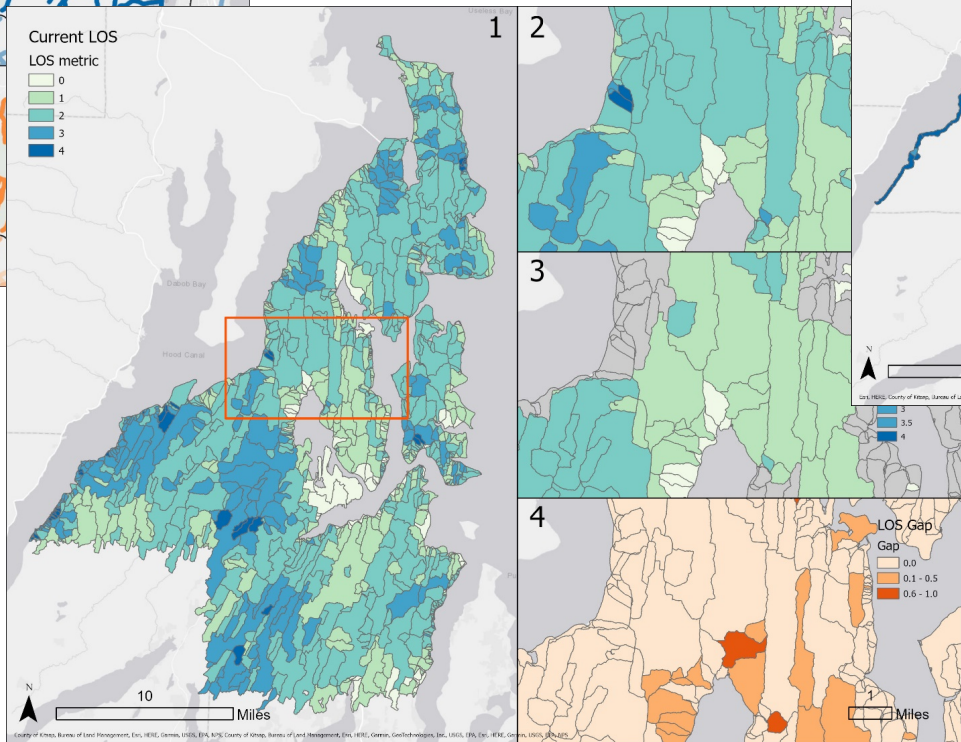

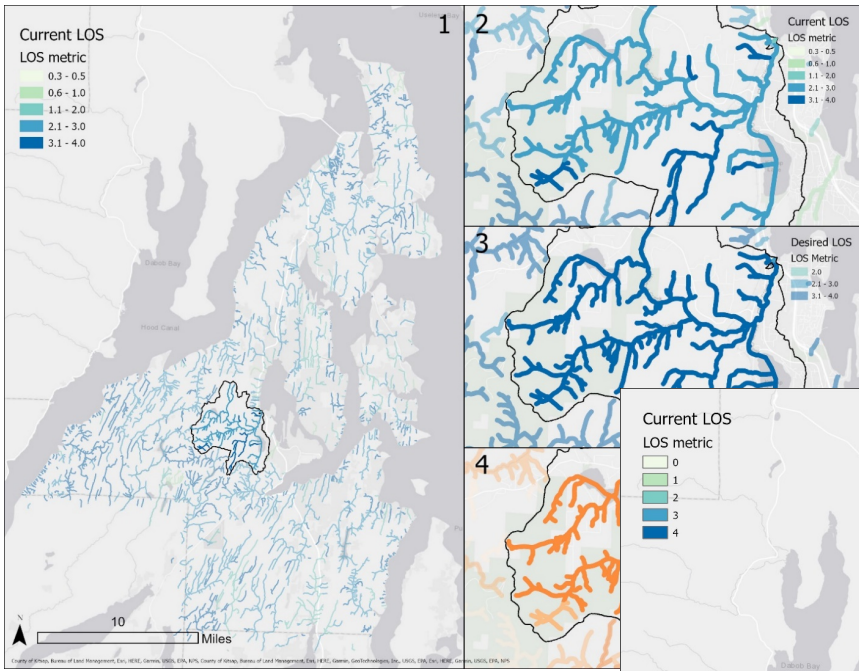

Levels of Service (LOS)

Marine Shoreline Asset Results

Forest Asset Results

Riparian Asset Results

Limitations to Operationalizing Natural Asset Management

- Emerging discipline
- Data and information gaps
- Clear definitions
- Natural resource manager silos
- Staff capacity
- Relationships with neighboring and overlapping jurisdictions
- Effective and equitable stakeholder/rightsholder engagement
- Support through funding and research
- Equitable decision-making processes
